**TITLE**

**PHARMACEUTICAL PREPARATION**

**BACKGROUND OF THE INVENTION**

The present invention relates to the co-administration, either simultaneously, separately or sequentially of a selective  $I_{K_s}$  antagonist and a beta-adrenergic receptor blocking agent for use in preventing, treating and terminating cardiac arrhythmias, such as atrial, supraventricular and ventricular ectopy, tachycardia, flutter or fibrillation, including atrial, supraventricular and ventricular arrhythmias resulting from myocardial ischemic injury in a patient in need thereof. This invention also relates to a pharmaceutical formulation which comprises a selective  $I_{K_s}$  antagonist and a beta-adrenergic receptor blocking agent along with a pharmaceutically acceptable carrier.

Arrhythmias often occur as complications to cardiac diseases such as myocardial infarction and heart failure. In a serious case, arrhythmias give rise to ventricular fibrillation and can cause sudden death.

Though various antiarrhythmic agents are now available on the market, agents exhibiting both satisfactory effects and high safety profiles, are not yet available for patients. For example, antiarrhythmic agents of Class I, according to the classification of Vaughan-Williams, which cause a selective inhibition of the maximum velocity of the upstroke of the action potential ( $V_{max}$ ) are inadequate for preventing ventricular fibrillation. In addition, they have problems regarding safety, namely, they cause a depression of the myocardial contractility and have a tendency to induce arrhythmias due to an inhibition of the impulse conduction. Beta-adrenergic receptor blocking agent which belong to Class II are of limited value since their effects are either limited to a certain type of arrhythmia or are contraindicated because of their cardiac depressant properties in certain patients with cardiovascular disease. Their safety, however, is higher than that of the antiarrhythmic agents of Class I.

- 2 -

Antiarrhythmic agents of Class III are drugs which cause a selective prolongation of the duration of the action potential without a significant depression of the Vmax. Until recently, drugs in this class were limited to sotalol and amiodarone, both of which have been shown to possess Class III properties. However, Sotalol also possesses Class II effects which may cause cardiac depression and be contraindicated in certain susceptible patients. Amiodarone is severely limited by side effects. Drugs of this class are expected to be effective in preventing ventricular fibrillations. Pure Class III agents, by definition, are not considered to cause myocardial depression or an induction of arrhythmias due to the inhibition of the action potential conduction as seen with Class I antiarrhythmic agents.

Recently, a novel group of Class III agents have been disclosed which antagonize the IKs channel found in heart muscle. These compounds IKs channel antagonists are effective in treating and preventing all types of arrhythmias including ventricular and atrial (supraventricular) arrhythmias. These novel compounds are disclosed and claimed in U.S. Patent Application, Serial Nos. 08/411,240; 08/516,467; and 08/516,226 which are hereby incorporated by reference. These novel compounds are especially useful for controlling reentrant arrhythmias and preventing sudden death due to ventricular fibrillation. These compounds are also effective in treating and preventing impaired cardiac pump functions.

In the treatment of arrhythmia, IKs antagonists have demonstrated effectiveness when delivered orally in amounts ranging from about 0.01 to about 1 mg per kg of body weight per day, in a single dose or in 2 to 4 divided doses.

The activity of the compounds described herein as antiarrhythmic agents is measured by their ability to block the IKs and IKr currents as determined by the following test protocol.

Outward potassium currents are measured in single guinea pig ventricular myocytes using a whole-cell voltage clamp technique described in detail elsewhere (Sanguinetti and Jurkiewicz, 1990, Two components of cardiac delayed rectifier K<sup>+</sup> current: differential

- 3 -

sensitivity to block by Class III antiarrhythmic agents. *J. Gen Physiol.* 96: 195-215). Myocytes are isolated by enzymatic (collagenase and protease) digestion of Langendorf perfused hearts. Single cells are then voltage clamped using 1 mm square-bore pipettes filled with 0.5 M Kgluconate, 25 mM KCl, 5 mM K(2)ATP. Cells are bathed in a solution containing, in mM: 132 NaCl, 4KCl, 1.2 MgCl<sub>2</sub>, 10 HEPES, 10 glucose: pH 7.2, temp. 35°C.

Each cell is maintained at a holding potential of -50 mV. Test depolarizations are applied as voltage ramps from -85 to -50 mV, and as steps to -10 mV (0.5 s) and +50 mV (1.0 s). I<sub>K1</sub> is measured as peak outward current during the voltage ramp. I<sub>Kr</sub> is measured as tail currents upon repolarization from -10 mV to -50 mV. I<sub>ks</sub> is measured as time-dependent current during the pulse to +50 mV. Currents are measured during control, then after exposure to drug at two different concentrations.

Employing this test the compounds described herein as selective I<sub>ks</sub> channel antagonists, have an IC<sub>50</sub> of less than 100 nM as I<sub>ks</sub> antagonists. The compounds of this invention are at least 10 times more potent in the blockade of I<sub>ks</sub> than of blockade of I<sub>Kr</sub>.

Beta-adrenergic receptor blocking agents, or "beta-blockers", are a class of pharmaceutically active compounds which decrease the positive chronotropic, positive inotropic, bronchodilator and vasodilator responses caused by beta-adrenergic receptor agonists. The magnitude of this decreased response is proportional to the existing sympathetic tone and the concentration of beta-blocker at the receptor sites. Beta-adrenergic receptor blockage is said to reduce cardiac output in both healthy subjects and patients with heart disease. While the mechanism of antihypertension effects of beta-adrenergic receptor blocking agents has not been established, possible mechanisms of action include reduction in cardiac output, reduction in plasma renin activity, and central nervous system sympatholytic action. The administration of beta-adrenergic receptor antagonists has been shown effective in reducing the incidence of mortality and sudden death in postinfarction

- 4 -

patients (Yusaf et al., Prog Cardiovasc Dis 17: 335-371, 1985; Lau et al., N Eng J Med 327: 248-254, 1992).

While both selective IK<sub>S</sub> channel blockers and beta-adrenergic receptor blocking agents have been proven effective when administered separately, it is considered to be in the best interest of the patient to reduce the amount of these compounds provided to the patient. Any reduction of one or the other compound would be considered helpful, but this is particularly true of beta-adrenergic receptor blocking agents which are known to have significant side effects in some humans.

This invention also relates to a pharmaceutical formulation which comprises a selective IK<sub>S</sub> antagonist and a beta-adrenergic receptor blocking agent along with a pharmaceutically acceptable carrier.

#### DETAILED DESCRIPTION OF THE INVENTION

A method is presented for use in preventing, treating and terminating cardiac arrhythmias, such as atrial, supraventricular and ventricular ectopy, tachycardia, flutter or fibrillation, including atrial, supraventricular and ventricular arrhythmias resulting from myocardial ischemic injury in a patient in need thereof which comprises the co-administration, either simultaneously, separately or sequentially of a selective IK<sub>S</sub> antagonist and a beta-adrenergic receptor blocking agent. - 5 -

By a "selective  $I_{K_s}$  antagonist" is meant those compounds which when studied in the test disclosed above have an IC<sub>50</sub> of less than 100 nM as  $I_{K_s}$  blockers. The compounds of this invention are at least 10 times more potent in the blockade of  $I_{K_s}$  than of blockade of  $I_{K_r}$ .

Beta-adrenergic receptor blocking agents are compounds which decrease the positive chronotropic, positive inotropic, bronchodilator and vasodilator responses caused by beta-adrenergic receptor agonists. The magnitude of this decreased response is proportional to the existing sympathetic tone and the concentration of beta-adrenergic receptor blocking agent which reaches the receptor sites.

Examples of compounds which fit the definition of beta-adrenergic receptor blocking agent include but are not limited to timolol, sotalol, esmolol, cateolol, propranolol, betaxolol, penbutolol, metoprolol, acebutolol, atenolol, metoprolol, pindolol, and bisoprolol, and their salts, hydrates, solvates and any crystal forms in which they may occur.

Examples of compounds which fit the definition of selective  $I_{K_s}$  antagonists include, but are not limited to, the following:

The selective IK<sub>S</sub> blockers of the present invention have the pharmacological properties required for antiarrhythmic agents of Class III, namely they demonstrate prolongation of QTc-interval , and dose dependent increases in ventricular refractoriness. This is accomplished without effecting heart rate, mean arterial pressure and PR and QRS intervals. Modest increases in LV+dP/dt (left ventricular change in pressure with time) is observed. Further, these compounds suppress the induction of PVS (Programmed Ventricular Stimulation) induced ventricular tachyarrhythmias.

Individually, these compounds are effective in treating

- 20 -

and preventing all types of arrhythmias including ventricular, atrial and supraventricular arrhythmias. The compounds of the present invention are especially useful for controlling reentrant arrhythmias and prevent sudden death due to ventricular fibrillation. These compounds are also effective in treating and preventing impaired cardiac pump functions.

In the novel method of this invention of treating arrhythmia, a selective  $I_{Ks}$  antagonist is administered in an amount ranging from about .0001 to about 10 mg per kg of body weight per day, preferably from about .0001 to about 2 mg per kg of body weight per day, and more preferably, when intravenous delivery of the compounds is employed, from about 0.0003 to about 0.3 mg per kg of body weight per day, or when given orally from about 0.01 to about 1 mg per kg of body weight per day, in a single dose or in 2 to 4 divided doses of each compound. The beta-adrenergic receptor blocking agent is administered in an amount ranging from about 1 mg per day to about 300 mg per day and more preferably from about 2 mg/day to about 250 mg per day.

The activity of the compounds described herein as antiarrhythmic agents is measured by their ability to block the  $I_{Ks}$  and  $I_{Kr}$  currents as determined by the following test protocol.

Outward potassium currents are measured in single guinea pig ventricular myocytes using a whole-cell voltage clamp technique described in detail elsewhere (Sanguinetti and Jurkiewicz, 1990, Two components of cardiac delayed rectifier  $K^+$  current: differential sensitivity to block by Class III antiarrhythmic agents. J. Gen Physiol. 96: 195-215). Myocytes are isolated by enzymatic (collagenase and protease) digestion of Langendorf perfused hearts. Single cells are then voltage clamped using 1 mm square-bore pipettes filled with 0.5 M Kgluconate, 25 mM KCl, 5 mM K(2)ATP. Cells are bathed in a solution containing, in mM: 132 NaCl, 4KCl, 1.2 MgCl<sub>2</sub>, 10 HEPES, 10 glucose: pH 7.2, temp. 35°C.

Each cell is maintained at a holding potential of -50 mV. Test depolarizations are applied as voltage ramps from -85 to -50 mV, and as steps to -10 mV (0.5 s) and +50 mV (1.0 s).  $I_{KJ}$  is measured as

- 21 -

peak outward current during the voltage ramp.  $I_{Kr}$  is measured as tail currents upon repolarization from -10 mV to -50 mV.  $I_{Ks}$  is measured as time-dependent current during the pulse to +50 mV. Currents are measured during control, then after exposure to drug at two different concentrations.

Employing this test the compounds described herein as selective  $I_{Ks}$  blockers have an IC<sub>50</sub> of less than 100 nM as  $I_{Ks}$  blockers. The compounds of this invention are at least 10 times more potent in the blockade of  $I_{Ks}$  than of blockade of  $I_{Kr}$ .

Typical synthetic schemes employed in making the compounds herein are illustrated below.

(E)-(+)-N-[(3R)-2,3-Dihydro-1-methyl-2-oxo-5-phenyl-1H-1,4-benzodiazepin-3-yl]-3-phenyl-2-propenamide

---

A solution of (E)-3-phenyl-2-propenoyl chloride (367 mg, 2.2 mmol) in methylene chloride (1 mL) was added to a solution of 3(R)-amino-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one (*J. Org. Chem.* 1987, 52, 3232-3239) (531 mg, 2.0 mmol) and triethylamine (307 mL, 225 mg, 2.2 mmol) in methylene chloride (10 mL). The mixture was stirred at room temperature for 25 min. and the solvent was evaporated under reduced pressure. The residue was purified by flash column chromatography on silica gel, eluting with CH<sub>2</sub>Cl<sub>2</sub>/Et<sub>2</sub>O (95:5) and the residue was triturated with Et<sub>2</sub>O. The solid was collected and dried *in vacuo* at 70°C to give (E)-(+)-N-[(3R)-2,3-dihydro-1-methyl-2-oxo-5-phenyl-1H-1,4-benzodiazepin-3-yl]-3-phenyl-2-propenamide as a colorless solid (170 mg, 21%), m.p. 140-142°C, [α]<sub>D</sub> +86.7° (c=0.173, CH<sub>2</sub>Cl<sub>2</sub>).

The mixture was stirred at room temperature for 18 h., poured into aqueous hydrochloric acid (3M, 12 mL) and extracted with ethyl acetate (3 x 20 mL). The combined organic fractions were washed with saturated aqueous sodium hydrogen carbonate (20 mL) and brine (20 mL), dried (MgSO<sub>4</sub>) and evaporated under reduced pressure. Step A:

Diethyl 1-benzylpiperidine-4,4-diacetate

Ethanol (120 mL) was cooled in ice and ammonia bubbled through to give a saturated solution. 1-Benzyl-4-piperidone (40.0g, 211mmol) and ethyl cyanoacetate (47.8g, 423 mmol) were added, the reaction vessel stoppered and stored at 0°C overnight. The solid was collected, washed with ethanol and ether and dried in vacuo to give a yellow solid (68.86g). The solid (58.86g) was dissolved in a mixture of sulfuric acid (70 mL, 98%) and water (60 mL) and heated under reflux for three days the mixture cooled and most of the water evaporated. The residue was azeotroped with ethanol (4x750 mL), further ethanol (500 mL) added and the mixture heated under reflux for 20h, cooled in ice and sodium carbonate (100g) added slowly with vigorous stirring. The ethanol was evaporated under reduced pressure, water (800 mL) added and the mixture extracted with methylene chloride (3x400 mL). The combined organic extracts were dried (Na<sub>2</sub>SO<sub>4</sub>) and the solvent evaporated to give diethyl 1-benzylpiperidine-4,4-diacetate (37.51g). A small portion of this was purified by flash column chromatography.

Step B:

1-Benzylpiperidine-4,4-diethanol

A solution of the diester (12.2 g, 35 mmol) in ether (25 mL) was added to a cooled (-30°C) and stirred suspension of LiAlH<sub>4</sub> (2.1 g, 55 mmol) in ether (400 mL), under argon. THF (60 mL) was added and the reaction mixture allowed to warm to room temperature. After recooling to 0°C, water (2.2 mL), 1M NaOH (4.4 mL) and water (5 mL) were added, the reaction mixture stirred vigorously for 30 min and the solid filtered off, washing well with ether. The combined filtrates were evaporated to afford a white solid which was triturated with ether to give 8 g of 1-benzylpiperidine-4,4-diethanol.

1-t-Butoxycarbonylpiperidine-4,4-diethanol

The benzylamine (2.07 g, 7.9 mmol) was dissolved in methanol (60 mL), BOC<sub>2</sub>O (1.72 g, 7.9 mmol) added and the mixture hydrogenated at 50 psi over 10% palladium hydroxide on charcoal (200 mg) for 18 hours. The reaction mixture was filtered through celite, washed with methanol and the filtrate evaporated to give 1-t-butoxycarbonylpiperidine-4,4-diethanol (2.0 g).

Step D:

1-t-Butoxycarbonylpiperidine-4,4-diethanol, bis(methanesulfonate)

The diol (2.41 g, 8.9 mmol) was dissolved in dichloromethane (50 mL), the solution cooled to -20°C under argon before addition of triethylamine (3.7 mL, 26 mmol) and methanesulfonyl chloride (1.6 mL, 20 mmol). After 30 min., the reaction mixture was poured into ice cold 10% citric acid and extracted with ether (X3). Diethyl 3-t-butyloxycarbonyl-3-azaspiro[5.5]undecane-9,9-dicarboxylate

To a slurry of 60% NaH (2.04 g, 0.51 mole) in toluene (160 mL), under argon, was slowly added diethyl malonate (3.72 mL, 24.3 mmol). The mixture was cooled to 0°C and the bis-mesylate 1 (7.0 g, 16.3 mmol) added as a solid and the mixture heated to reflux for 18 hours. The reaction was quenched into 10% citric acid (100 mL) and the product extracted with CH<sub>2</sub>Cl<sub>2</sub> (2x150 mL). The extracts were dried (Na<sub>2</sub>SO<sub>4</sub>), concentrated to an oil, and chromatographed on silica to give 3.83 g (60%) of diethyl 3-t-butyloxycarbonyl-3-azaspiro-[5.5]undecane-9,9-dicarboxylate.

3-t-Butyloxycarbonyl-3-azaspiro[5.5]undecane-9-carboxylic acid

To a solution of the diester 2 (3.69 g, 0.0093 m) in THF (50 mL) was added 1N LiOH (47 mL). The reaction was stirred for 3 days at 25°C, diluted with water (50 mL) and pH adjusted to 2.2 with KHSO<sub>4</sub>. The product was extracted into ethyl acetate (2x75 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), and concentrated to a foam (3.5 g). The solid was melted in a flask at 140°C for 2 hours, cooled and the oil dissolved in THF (15 mL), 1N LiOH (10 mL) added and mixture stirred overnight at 30°C. The reaction was concentrated to remove THF, diluted with water (20 mL) and washed with diethyl ether (10 mL). The pH was adjusted to 2.5 with KHSO<sub>4</sub> and product extracted (3x50 mL) with ethyl acetate. The extracts were dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated to yield 3-t-butyloxycarbonyl-3-azaspiro[5.5]undecane-9-carboxylic acid as a foam (2.48 g, 90%).

Step A:

To a solution of 2,3-dihydro-1-methyl-5-phenyl-1H-pyrido[3,4-e]-1,4-diazepine-2-one (*Can. J. Chem.* 1987, 65, 1158-1161) (1.43 g, 5.7 mmol) in toluene (28 mL) under argon cooled to -20°C (ice/methanol bath) was added potassium t-butoxide (1.59 g, 14.2 mmol). The resulting purple suspension was stirred 15 min. at -20 °C and isoamyl nitrite (0.92 mL, 6.8 mmol) was added. The mixture was stirred at -20°C for 30 min., then poured into a mixture of water (25 mL), acetic acid (2.5 mL), and ethyl acetate (55 mL). The mixture was stirred to dissolve all solids and the layers were separated. The aqueous layer was extracted with ethyl acetate (2 x 55 mL). The combined organic fractions were washed with saturated sodium bicarbonate solution and brine (20 mL each), dried ( $\text{Na}_2\text{SO}_4$ ), and the solvent was evaporated under reduced pressure. The residue was triturated with hexane and the solid was collected and dried *in vacuo* to give 2,3-dihydro-3-hydroxyimino-1-methyl-5-phenyl-1H-pyrido[3,4-e]-1,4-diazepine-2-one (1.60 g, 100%) as a tan foam.

#### N-[2,3-Dihydro-1-methyl-2-oxo-5-isopropyl-1H-1,4-benzodiazepin-3-yl]-3-(2,4-dichlorophenyl)propanamide

##### Step A:

- 115 -

To a solution of the benzodiazepine (1.0 g, 5.3 mmol) in THF (20 mL) at -78°C under argon was added 60% (NaH, 2.52 g, 6.3 mmol) Boc anhydride (1.27 g, 5.8 mmol) and the mixture stirred at -78°C for 1/2 hour. The reaction was then allowed to warm to 25°C and stirred for 2 hours before quenching into cold aq. NH4Cl (10%) and extracting the product into ethyl acetate (3x50 mL). Concentration of the dried (Na2SO4) extracts gave an oil which was passed through silica (EtOAc/hexane) to give 1.35 g product (89%).

<sup>1</sup>H NMR (CDCl<sub>3</sub>) d: 1.60 (s, 9H), 3.40 (s, 3H), 3.95 (brd, 1H), 4.80 (brd, 1H), 7.20 (d, 1H), 7.30 (q, 1H), 7.60 (t, 1H), 7.92 (d, 1H).

Step B:

To a solution of the BOC-benzodiazepine (4.0 g, 13.8 mmol) in THF (80 mL) under argon was rapidly added a solution of isopropylmagnesium chloride (2.0 M) in THF (7.66 mL, 15.3 mmol). The reaction was stirred for 1/2 hour, quenched into aq NH4Cl (50 mL), and extracted with ethyl acetate (2x200 mL). The organic extracts were concentrated and chromatographed on silica (1:1, EtOAC/hexane) to give 1.55 g (34%) of product.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) d: 1.14 (d, 3H), 1.19 (d, 3H), 1.40 (s, 9H), 3.13 (s, 3H), 3.2-3.8 (m, 3H), 5.45 (brs, 1H), 7.28 (dt, 1H), 7.48 (dt, 1H), 7.56 (dt, 1H), 7.72 (dd, 1H).

- 116 -

Step C:

To a 0°C solution of the isopropylphenone (1.55 g) in ethyl acetate was added anhydrous HCl gas over 90 min. The reaction was then concentrated in vacuo to give a solid which was dissolved in H<sub>2</sub>O (40 mL) and the pH adjusted to 11.0 with 1N LiOH. After 30 min. at pH = 11.0 the pH was adjusted to 7.0 with 1N HCl and product extracted into ethyl acetate. The organic extracts were dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated to give a solid 1.22 g, 100%.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) δ: 0.95 (d, 3H), 1.30 (d, 3H), 3.16 (septet, 1H), 3.36 (s, 3H), 3.60 (d, 1H), 4.60 (d, 1H), 7.2-7.3 (m, 2H), 7.45-7.55 (m, 2H).

Step D:

The benzodiazepine obtained in Step C was converted to the oxime as described in Example 80 Step A.

Step E:

The oxime (2 gms) was dissolved in acetic acid (150 mL) and 10% Pd/C (1 gm) added. The mixture was stirred rapidly under an atmosphere of hydrogen for 90 min or until complete by HPLC. The reaction was filtered, the catalyst washed with methylene chloride (200 mL) and the filtrates concentrated in vacuo to an oil. The oil was dissolved in saturated aqueous sodium bicarbonate (100 mL) and product extracted with ethyl acetate (3 x 150 mLs). Concentration of the dried (Na<sub>2</sub>SO<sub>4</sub>) extracts gave 2.60 gms (97%).

Step F:

- 117 -

The anine was coupled with 3-(2,4-dichlorophenyl)-propionic acid as described in Example 43 to yield N-(2,3-dihydro-1-methyl-2-oxo-5-isopropyl-1H-1,4-benzodiazepin-3-yl)-3-(2,4-dichlorophenyl)propanamide.

<sup>1</sup>H NMR (CDCl<sub>3</sub>) d: 0.92 (d, 3H), 1.25 (d, 3H), 2.65 (dt, 2H), 3.05 (t, 2H), 3.15 (SepT, 1H), 3.40 (s, 3H), 5.38 (d, 1H), 7.0-7.6 (m, 8H).

The following compounds were prepared in a similar manner as described in Example 81, using the appropriate Grignard reagent in place of isopropyl magnesium chloride.

**Step A:** Preparation of N-tert-butyloxycarbonyl-4-(4-chlorobenzyl)-4-piperidinecarboxylic acid

A solution of N-Boc-ethylisonipecotate (51.4 g, 200 mmole) in THF (1L) at -60° C was treated with a solution of lithium bis(trimethylsilyl) amide (220 mL of a 1 N solution in THF, 220 mmole).

- 128 -

After stirring at -60°C for 5 minutes, a solution of 4-chlorobenzyl chloride (33.8 g, 210 mmole) in THF (200 mL) was added and the reaction allowed to warm to room temperature. Most of the THF (about 800 mL) was removed by evaporation at reduced pressure. The remainder was poured into 1 L of 1 N HCl and extracted with two 800 mL portions of ethyl acetate. The organic layers were combined and washed once with saturated sodium bicarbonate (500 mL), dried over anhydrous magnesium sulfate, filtered, and concentrated at reduced pressure. The residue was chromatographed on silica gel eluting with 10%-20% ethyl acetate/hexane to give the product ester which was used directly. The material thus obtained was dissolved in THF (100 mL) and IPA (100 mL) and treated with 350 mL of 10 N NaOH. The mixture was heated to reflux for 30 hours. The reaction was cooled to room temperature and poured over a mixture of crushed ice (2 L), 6 N HCl (500 mL) and saturated potassium hydrogen sulfate (1 L). The mixture was extracted with two 1 L portions of ethyl acetate. The organic layers were combined and dried over anhydrous magnesium sulfate, filtered, and concentrated at reduced pressure to give 52 g of the product.

Step A: Preparation of 2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepine.

A solution of 5-phenyl-1,4-benzodiazepine-2-one (*J. Org. Chem.*, 1962, 27, 3788)(50 g, 0.211 mole) in DMF (100 mL) was treated with cesium carbonate (103.5 g, 0.317 mole) and trifluoroethyl iodide (109.7 g, 0.525 mole). The mixture was stirred at 50°C overnight. The reaction mixture was then poured into water (2 L) and extracted with ethyl acetate (3 X 1 L). The combined ethyl acetate fractions were dried over anhydrous magnesium sulfate, filtered and concentrated at reduced pressure. The residue was crystallized from ethyl ether to give 45 g (68 %) of the product. MP = 130 - 131°C; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 7.65-7.60 (m, 2H), 7.60-7.45 (m, 5H), 7.40-7.20 (m, 2H), 5.25 (dq, J = 14, 8.6 Hz, 1H), 4.82 (d, J = 10.5 Hz, 1H), 4.15 (app sextet, J = 8.6 Hz, 1H), 3.81 (d, J = 10.5 Hz, 1H)

A solution of 2,4,6-triisopropylbenzenesulfonylazide (74.8 g, 0.24 mol) in THF (250 mL) was added over 5 min. This was stirred for 10 minutes and acetic acid (40 mL, 0.63 mol) was added and the reaction allowed to warm to ambient temperature. The reaction was poured into satd. NaHCO<sub>3</sub> (1500 mL) and ethyl acetate (1L). The phases were separated and the aqueous phase was extracted with ethyl acetate (500 mL). The combined organic layers were washed with water (500 mL) then brine (300mL). The organic layers were dried with Na<sub>2</sub>SO<sub>4</sub> and evaporated to a brown foam. This was triturated with ethyl ether to give 65 g of a white powder. The filtrate was concentrated and chromatographed over silica gel eluting with 30% ethyl acetate/hexane to give another 8.9 g. The combined yield was 74 g (93%). MP = 159 - 160°C; 1H NMR (CDCl<sub>3</sub>, 300 MHz) δ 7.70-7.26 (m, 9H), 5.28-5.12 (m, 1H), 4.63 (s, 1H), 4.35-4.10 (m, 1H).

The combined organics were washed with 2x200mL water, dried with brine and Na<sub>2</sub>SO<sub>4</sub>, and evaporated under reduced pressure. The residue was taken up in a minimum of diethyl ether and crystallized by adding sufficient hexane to precipitate the product. The solid was collected to give 7.74g of 2,4-bis(trifluoromethyl) phenyl acetic acid as white crystals, 68.5%.NMR <sup>1</sup>H (CDCl<sub>3</sub>) d 7.93 (s,1H), 7.80 (d, J=7.9Hz,1H), 7.55 (d, J=7.9Hz,1H), 3.94 (s,2H).

To a stirring solution the 3R-3-Amino-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-2,3-dihydro-1H-benzo[e][1,4]diazepine (28.4 mmol, 9.47g) in DMF (100mL) was added 2,4-Bis(trifluoromethyl) phenyl acetic acid (28.4mmol,7.74g), 1-(3-Dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (42.6mmol,8.16g) and 1-Hydroxy-benztriazole hydrate (14.2mmol,1.92g). This was stirred for 1h at room temperature. The reaction was then diluted with 750mL of 10% KHSO<sub>4</sub> and extracted with ethyl acetate (2x300mL). The organic layers

were combined and washed with saturated sodium hydrogen carbonate (1x600mL). The organics were then dried with brine, and sodium sulfate and evaporated under reduced pressure. The residue was chromatographed over silica eluting with 20% EtOAc:Hexane. Pure fractions were collected and evaporated. The residue was taken up in 100 mL of warm 75% isopropanol:water. This was allowed to cool slowly and stirred overnight (16 hr) at room temperature. The suspension was cooled briefly to @5°C and filtered. The white solid was dried overnight at 60°C to give 10.5 g of material that melted at 132-134°C. X-Ray diffraction confirms crystallinity.

### EXAMPLE 131

Antiarrhythmic efficacy of the combined administration of low dose I<sub>Ks</sub> blocker (-)-2-[2,4-bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide and the beta-adrenergic receptor antagonist timolol in anesthetized dogs with previous anterior myocardial infarction was studied. This study was conducted to test the hypothesis the concomitant administration of low dose I<sub>Ks</sub> blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide and

- 162 -

low dose beta-adrenergic receptor antagonist timolol, which when administered individually at low dose afford no significant anti-arrhythmic protection, would in combination provide significant protection against the development of malignant ventricular arrhythmias in a canine model of previous myocardial infarction. In the absence of protective intervention, this postinfarction canine preparation displays a very high incidence (80%) of malignant ventricular tachycardia degenerating into ventricular fibrillation and death in response to the development of ischemia at a site remote from previous myocardial infarction (Patterson et al., Am. J. Cardiol. 50: 1414-1423, 1982; Wilber et al., Am. Heart J. 109: 8-18, 1985; Lynch et al., J Pharmacol Exp Therap 277: 671-678, 1996).

## METHODS

### Surgical Preparation.

Male or female purpose-bred mongrel dogs (7-12 kg) were preanesthetized with sodium thiamylal (5.0 mg/kg i.v.) and general anesthesia was induced with isoflurane. A left thoracotomy was performed in the 4th intercostal space, the pericardium incised, and the heart suspended in a pericardial cradle. Anterior myocardial infarction was produced by a two hour occlusion of the left anterior descending coronary artery followed by reperfusion. Surgical incisions were closed, and the animals were allowed to recover.

### Electrophysiologic Testing, Programmed Ventricular Stimulation (PVS) and Acute Posterolateral Myocardial Ischemia

---

Purpose-bred male or female mongrel dogs at 5-20 days after anterior myocardial infarction were anesthetized with alpha chloralose (80.0-100.0 mg/kg i.v.). The animals were ventilated by means of a cuffed endotracheal tube and a volume-cycled respirator (Model 613, Harvard Apparatus, S. Natick, MA). Systemic arterial pressure was monitored via the cannulated left common carotid artery (Model P23XL pressure transducer, Gould Inc, Cleveland, OH), and the

- 163 -

right femoral vein was isolated and cannulated for drug administration. The heart was re-exposed via a left thoracotomy, and was suspended in a pericardial cradle. A platinum epicardial bipolar electrode (3 mm electrode post separation) was sutured to the surface of the left atrial appendage for atrial pacing, and a stainless steel bipolar plunge electrode (5 mm length, 3 mm electrode post separation) was inserted into the interventricular septum near the right ventricular outflow tract (RVOT) adjacent to the site of left anterior descending coronary artery occlusion for the introduction of ventricular extrastimuli during programmed ventricular stimulation (PVS). One acrylic button per zone containing fixed stainless steel bipolar plunge electrodes (see below for specifications) was sutured into the infarcted anterior region of the left ventricle distal to the site of coronary artery occlusion and within the area of myocardial scarring as ascertained visually and by palpation (IZ, infarct zone) and into the non-infarcted posterolateral region of the left ventricle (NZ, non-infarct zone) for the measurement of ventricular electrophysiologic parameters (excitation thresholds and refractory periods). Lead II electrocardiogram was monitored continuously.

After stabilization of the preparation and the measurement of baseline electrocardiographic and cardiac electrophysiologic parameters, PVS consisting of the introduction of 1-3 ventricular extrastimuli during sinus rhythm and atrial pacing was performed at the RVOT site. If ventricular extrastimuli could not be inserted at the RVOT site, programmed pacing was attempted at the IZ site. Ventricular extrastimuli were introduced at 2x diastolic threshold voltage or, if extrastimuli were not introduced adequately, at 4x diastolic threshold voltage. Responses to baseline programmed ventricular stimulation were categorized as: 1) non-inducible (NI): less than 5 nonstimulated ventricular complexes; 2) nonsustained ventricular tachycardia (NSVT): 5 or more nonstimulated ventricular complexes terminating spontaneously with a duration less than 15 seconds; 3) unimorphic sustained ventricular tachycardia (UVT): unimorphic ventricular tachycardia with a duration exceeding 15 seconds; 4) polymorphic sustained ventricular tachycardia (PVT):

- 164 -

polymorphic ventricular tachycardia with a duration exceeding 15 seconds, and 5) ventricular tachycardia degenerating into ventricular fibrillation (VT/VF): an unstable ventricular tachycardia degenerating spontaneously into ventricular fibrillation. In this study, programmed pacing was continued until the induction of either sustained VT or VT/VF, or until the end of the pacing protocol with either NSVT or no response (NI) occurring. In many preparations ultimately responding to programmed stimulation with either SVT or VT/VF, reproducible NSVTs were initiated early in the pacing protocol. Only postinfarction preparations responding to baseline PVS with inducible sustained ventricular tachyarrhythmias (UVT, PVT or VT/VF) were entered into the present study. Baseline response to PVS with inducible ventricular tachyarrhythmias has been found to correlate strongly with the development malignant ventricular tachycardia, fibrillation and arrhythmic death in response to a subsequent episode of myocardial ischemia at a site remote from previous infarction in this animal model (Wilber et al., Am. Heart J. 109: 8-18, 1985).

Following the completion of baseline and post treatment electrophysiologic and PVS testing, the tip of a silver wire electrode was inserted through the wall and into the lumen of the proximal left circumflex (LCX) coronary artery. An anodal current of 200 µA was applied to the intimal surface of the coronary artery via this electrode, producing intimal injury, thrombus formation and ultimately acute myocardial ischemia in the left circumflex coronary artery distribution. The onset of acute posterolateral myocardial ischemia was noted electrocardiographically. Upon the development of lethal ischemic arrhythmias or at 3 hours after the onset of acute posterolateral myocardial ischemia, the hearts were excised and wet thrombus mass in the left circumflex coronary artery determined. Anterior myocardial infarct size was determined by cutting the heart into 1 cm thick transverse sections which then were incubated in 0.4% triphenyltetrazolium chloride solution. Reaction with triphenyltetrazolium forms a red precipitate in viable tissue, whereas infarcted tissue remains pale. Infarct size was

- 165 -

quantitated gravimetrically and was expressed as a percentage of total left ventricle.

The responses (i.e. occurrence of vs protection from the development of lethal ventricular arrhythmia) of five experimental groups to the development of acute posterolateral ischemia at a site remote from previous myocardial infarction were compared in this study: 1) the laboratory cohort of aqueous vehicle (saline or PEG/saline)-treated control animals (n=40); 2) a dedicated soy bean oil-based microemulsion vehicle (20.0% soy bean oil, 2.0% glycerin, 1.2% lecithin and 76.8% water)-treated control group (n=10); 3) low dose 0.0003 mg/kg i.v.  $I_{K_s}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide in soy bean oil-based microemulsion (n=10); 4) low dose 0.001 mg/kg i.v. beta-adrenergic receptor blocking agent timolol in 5% dextrose in saline vehicle (n=6); and 5) the combination of low dose 0.0003 mg/kg i.v.  $I_{K_s}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide with low dose 0.001 mg/kg i.v. beta-adrenergic receptor blocking agent timolol (n=10). In the individual and combination  $I_{K_s}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide and beta-adrenergic receptor blocking agent timolol treatment groups, treatments were administered i.v. 15 min prior to the conduct of post treatment PVS and production of ischemia at a site remote from previous infarction.

#### Statistics.

Data are expressed as mean  $\pm$  S.E.M. Comparisons among treatment groups were made using a single factor ANOVA or a Fisher's exact test, when appropriate. P 0.05 was the criterion for statistical significance.

## RESULTS

All animals in all treatment groups responded to baseline PVS with inducible ventricular tachyarrhythmias as an entry criterion. The incidences of ischemic lethal ventricular arrhythmias (ventricular fibrillation; VF) occurring in the laboratory control cohort, dedicated microemulsion vehicle control group, low dose  $I_{Ks}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide, low dose beta-adrenergic receptor blocking agent timolol, and combined low dose  $I_{Ks}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide with beta-adrenergic receptor blocking agent timolol groups are summarized below.

Neither low dose  $I_{K_s}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide nor low dose beta-adrenergic receptor antagonist timolol administered individually afforded significant protection against the development of malignant ischemic ventricular arrhythmias and death compared to either the laboratory vehicle control cohort or the dedicated microemulsion vehicle control group. In contrast, the combined administration of both low dose  $I_{K_s}$  blocker (-)-2-[2,4-Bis(trifluoromethyl)phenyl]-N-[3R-2,3-dihydro-2-oxo-5-phenyl-1-(2,2,2-trifluoroethyl)-1H-benzo[e][1,4]diazepin-3-yl]acetamide and low dose beta-adrenergic receptor antagonist timolol provided significant protection against development of malignant ischemic ventricular tachyarrhythmia and arrhythmic death, which signifies a synergistic salutary antiarrhythmic interaction between block of  $I_{K_s}$  and beta-adrenergic receptor blockade.
